Chem 1B Objective 7:
Understand equilibrium reactions (equilibrium constant, LeChatelier's principle, equilibrium calculation).

Key Ideas: Many important reactions are equilibrium reactions, e.g., many reactions in our body.

Chem 1A: Reactants form products. Reaction goes in one direction - forward.
Equilibrium reaction: Reaction goes forward and backwards ==> reversible reaction.

How far does a reaction occur? See $\mathrm{K}_{\text {eq }}$
$\mathrm{K}_{\text {eq }}$ is constant but changes with T .
Calculate [ ] from $\mathrm{K}_{\mathrm{eq}}$. Compare to stoichiometry calculation.
LeChatelier's principle - make a reaction go forward or reverse

# An Equilibrium Reaction Goes In The Forward and Reverse Directions (Reversible Reaction) 

Reactants react to form products:
Products react to re-form reactants:

$$
A+B
$$

$C+D$

At Equilibrium, reactants and products will be present.

At Equilibrium, reactants and products will be present.
The ratio of reactants and products is quantified with an
Equilibrium Constant: $\mathrm{K}_{\mathrm{eq}}=\frac{\Pi[\text { products }]^{n}}{\Pi[\text { reactants }]^{m}}$

Example: $a A+b B \Leftrightarrow c C+d D$

$$
\mathrm{K}_{\mathrm{eq}}=\frac{[\mathrm{C}]^{\mathrm{c}}[\mathrm{D}]^{\mathrm{d}}}{[\mathrm{~A}]^{\mathrm{a}}[\mathrm{~B}]^{\mathrm{b}}}
$$

More reactants means $\mathrm{K}_{\text {eq }}$ is:
(i) $>1$
(ii) $=1$
(iii) $<1$

More products means $\mathrm{K}_{\text {eq }}$ is:
(i) $>1$
(ii) $=1$
(iii) < 1

Equilibrium Constant: $\mathrm{K}_{\mathrm{eq}}=\frac{\Pi[\text { products }]^{\mathrm{n}}}{\Pi[\text { reactants] }]^{m}}$
Which graph has a $\mathrm{K}_{\mathrm{eq}}>1$ ?

https://www.everythingmaths.co.za/science/grade-12/08-
chemical-equilibrium/08-chemical-equilibrium-03.cnxmlplus

Example: Acetic acid dissociates into its ions.

$$
\mathrm{CH}_{3} \mathrm{COOH}+\mathrm{H}_{2} \mathrm{O}-->\mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}_{3} \mathrm{O}^{+} \quad \mathrm{K}_{\mathrm{eq}}=1.8 \times 10^{-5}
$$

a. Write an equilibrium constant expression for this reaction.

$$
\mathrm{K}_{\mathrm{eq}}=
$$

Note: For a pure substance, e.g., solid or liquid, [ ] = 1. So $[\mathrm{H} 2 \mathrm{O}(\mathrm{I})]=1$.
b. At equilibrium, are more reactants present or more products?

Example: Acetic acid dissociates into its ions. $\mathrm{CH}_{3} \mathrm{COOH}+\mathrm{H}_{2} \mathrm{O}->\mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$

$$
K_{e q}=1.8 \times 10^{-5}
$$

a. Which picture represents this mixture at equilibrium?

A

O $=\mathrm{CH}_{3} \mathrm{COOH}$

B

$\Omega=\mathrm{CH}_{3} \mathrm{COO}^{-}$

$\square=\mathrm{H}_{3} \mathrm{O}^{+}$
b. Draw a concentration vs. time graph.

## Objective: Use LeChatelier's Principle To Control The

 Direction (Forward/Backward) Of A Reaction LeChatelier's Principle: When a stress is placed on a reaction, the reaction shifts in a direction that relieves the stress (and reestablishes equilibrium).| Stress | Stress Relief |
| :--- | :--- |
| Upset stomach | Rolaids |
| Add reactant | Rxn shifts toward products |
| Remove reactant | Rxn shifts toward reactants |
| Add product | Rxn shifts toward reactants |
| Remove product | Rxn shifts toward products |
| One minute left on the exam and two <br> pages to go | panic |
| Add/remove heat |  |
| Increase/decrease pressure |  |
| Someone looking over your shoulder | Anxiety |

## At Equilibrium, reactants and products will be present.

The ratio of reactants and products is quantified with an
Equilibrium Constant: $\mathrm{K}_{\text {eq }}=\frac{\Pi\left[\text { products] }{ }^{\mathrm{n}}\right.}{\Pi[\text { reactants }]^{m}}$

Example: $\mathrm{A}+\mathrm{B} \Leftrightarrow \mathrm{C}+\mathrm{D}$

$$
\mathrm{K}_{\mathrm{eq}}=\frac{[\mathrm{C}][\mathrm{D}]}{[\mathrm{A}][\mathrm{B}]}=5
$$

If Reactant $A$ is added, does $\frac{[C][D]}{[A][B]}$ increase or decrease?
This ratio DECREASES so reaction is no longer at equilibrium.
For reaction to get back to equilibrium, numerator [C] [D] has to increase ===> more products form ===> reaction shifts to product side.

## Objective: apply Equilibrium Principles

How can you get more salt to dissolve in water?
NaCl dissolution is endothermic.
Write a chemical equation that represents this reaction.

What is the effect of $T$ ?

What is the effect of adding more salt?

What is the effect of adding more water?
http://jerpchem11.blogspot.com/2010/03/solution-chemistry-
mar30.html

Aspirin Synthesis (Chem 1A Lab 4 ) is an Equilibrium Reaction.
Salicylic acid + acetic anhydride -- $\mathrm{H}_{3} \mathrm{PO}_{4}$ catalyst --> aspirin + acetic acid $\mathrm{C}_{7} \mathrm{H}_{6} \mathrm{O}_{3}+\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{3}--->\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}+\mathrm{CH}_{3} \mathrm{COOH}+$ heat
Reaction conditions affect Reaction Rate and Yield:
$\mathrm{T}=75^{\circ} \mathrm{C}$, time $=20$ minutes
Use excess $\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{O}_{3}-->$ reaction shifts to products --> higher yield. Reaction occurs:
(i) faster
(ii) slower

Use higher T --> reaction shifts to reactants --> lower yield. Reaction occurs: (i) faster
(ii) slower

Use catalyst --> no effect on equilibrium or yield
Reaction occurs: (i) faster
(ii) slower

You made Esters in Lab 1 in Chem 1B lab.
Acid + Alcohol ---> Ester + Water
Lab 4: How to Optimize the Yield?
a. Is the reaction exothermic or endothermic?
b. What is the effect of temperature in this reaction?
c. Should an excess of one reactant be used? If so, which reactant should be the excess reactant?
d. How can the yield be increased?
e. What does the sulfuric acid catalyst do?

Apply LeChatelier's Principle to Make Drano Work Better
Drano drain cleaner consists of AI filings and NaOH pellets. When water is added, the heat produced melts and saponifies the fat that clogs a drain.
$2 \mathrm{Al}(\mathrm{s})+2 \mathrm{NaOH}(\mathrm{s})+6 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})$--> $2 \mathrm{NaAl}(\mathrm{OH})_{4}(\mathrm{aq})+3 \mathrm{H}_{2}(\mathrm{~g})$
a. Would you expect this reaction to have a large K or small K ? Explain.
b. In terms of reactants and products, explain how this reaction can be shifted to the right (toward products).
c. If an excess amount of water is added, how will the reaction be affected?
d. If hot water was added instead of cold water, would Drano work better? In other words, which direction would the reaction shift? e. If the drain was plugged immediately after Drano was added to the clog, would Drano work better? In other words, which direction would the reaction shift?

Determine Reaction Conditions by Applying LC Principle Under the conditions of a car engine, nitrogen and oxygen reacts to form $\mathrm{NO}_{x}$, which is a component of smog:

$$
\begin{align*}
& \mathrm{N}_{2}+\mathrm{O}_{2}-\mathrm{-} 2 \mathrm{NO}  \tag{1}\\
& \mathrm{~N}_{2}+2 \mathrm{O}_{2}-->2 \mathrm{NO}_{2} \tag{2}
\end{align*}
$$

Under what temperature (low T or high T ) and pressure (low P or high $P$ ) conditions does each reaction occur? Give reasons based on LeChatelier's principle.
$\Delta H_{f}$ of NO $(\mathrm{g})=90.4 \mathrm{~kJ} / \mathrm{mole}==>$ Hess' s law ==> Rxn (1) is endothermic Increase in $T$ shifts reaction toward products ==> Use High T
$\Delta \mathrm{H}_{\mathrm{f}}$ of $\mathrm{NO}_{2}(\mathrm{~g})=33.9 \mathrm{~kJ} /$ mole $==>$ Hess' s law ==> Rxn (2) is endothermic Increase in T shifts reaction toward products ==> Use High T

Rxn (1): 2 moles of gas reactants --> 2 moles of gas products Changing $P$ does not shift reaction $==>$ Use Any $P$

Rxn (2): 3 moles of gas reactants --> 2 moles of gas products Increase in $P$ shifts reaction toward products $==>\underline{\text { Use High } P}$

500 million tons of Nitrogen Fertilizer is Produced Annually (as $\mathrm{NH}_{3}, \mathrm{NH}_{4} \mathrm{NO}_{3}$, and urea) and Uses 1-2\% of World's Energy Supply

## Plants Make $\mathbf{N H}_{3}$ from $\mathbf{N}_{\mathbf{2}}$ (Nitrogen Fixation)

The Haber process is the industrial process for the synthesis of ammonia from $\mathrm{N}_{2}$ and $\mathrm{H}_{2}$. In this process, the reaction conditions are high pressure and low temperature. A catalyst is used and product is removed from the reaction vessel during the reaction.
a. Write a chemical equation that represents the Haber process.
b. Explain why these reaction conditions are used. If a catalyst was not used, could a higher reaction temperature be used to optimize the yield? Give reasons.

## Does Salt Melt Ice?

$\Delta \mathrm{H}_{\text {solution }}$ of NaCl is close to 0 . So $q \approx 0$. Melting?
Melting: $\mathrm{H}_{2} \mathrm{O}(\mathrm{s})<==>\mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
As soon as some salt dissolves in the ice's surface film, the solute ions interfere with the $\mathrm{H}_{2} \mathrm{O}(\mathrm{I})$ molecules' (leftward) ability to join the solid lattice, and the equilibrium therefore shifts to the right: toward less solid and more solution. That is, the ice dissolves in the solution.

Pardon my vernacular, but that ain't melting, and it ain't no freezing point depression phenomenon, neither.

Yes, the solution's freezing point is lower than that of pure water, but so what? Our practical concern here is with ice dissolving into the solution, not the solution freezing into ice. CEN, 3/31/08, Newscripts, p. 56

Objective: Determine the amounts of reactants and products at $\qquad$

$$
\mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g})--->\mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) \quad \mathrm{K}=10^{140}
$$

Does this reaction occur? Why?
1 mole of $\mathrm{CH}_{4}(\mathrm{~g})$ burns in 5 moles of $\mathrm{O}_{2}$. Calculate the moles of products produced.

Solution (from Chem 1A):

Initial

$$
\mathrm{CH}_{4} \mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2} \mathrm{O}_{2}(\mathrm{~g})--->\mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{C}_{2} \mathrm{H}(\mathrm{~g})
$$

Amount reacts
Amount leftover/
produced

Objective: Determine the amounts of reactants and products at Equilibrium

Haber process: Chang, 6th ed., p. 539, Problem 15.72.
$\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g})<==>2 \mathrm{NH}_{3}(\mathrm{~g}) \quad \mathrm{K}_{\mathrm{p}}=4.31 \times 10^{-4}$ at $375^{\circ} \mathrm{C}$
In a certain experiment, a student starts with 0.862 atm of $\mathrm{N}_{2}$ and 0.373 atm of $\mathrm{H}_{2}$ in a constant volume vessel at $375^{\circ} \mathrm{C}$. Calculate the partial pressures of all species when equilibrium is reached.

Solution:
Initial p
Amount reacts
Amount at equilibrium

| $\mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{H}_{2}(\mathrm{~g})<==>$ | $2 \mathrm{NH}_{3}(\mathrm{~g})$ |  |
| :--- | :--- | :---: |
| 0.862 | 0.373 | 0 |
| $x$ | 3 x | 2 x |
| $0.862-\mathrm{x}$ | $0.373-3 \mathrm{x}$ | 2 x |

$$
K_{p}=4.31 \times 10^{-4}=\frac{(2 x)^{2}}{(0.862-x)(0.373-3 x)^{3}}
$$

Solve for x !

## Objective: Determine the amounts of reactants and products at Equilibrium

1 mole each of $\mathrm{H}_{2}$ and $\mathrm{I}_{2}$ are placed in a 1 I box at $490^{\circ} \mathrm{C}$. What are the concentrations of reactants and products at equilibrium?

$$
\mathrm{H}_{2}+\mathrm{I}_{2}<==>2 \mathrm{HI} \quad \mathrm{~K}=45.9 \text { at } 490^{\circ} \mathrm{C}
$$

Method: balance chemical equation set up "initial amount",
"amount reacts",
"amount at equilibrium"
plug "equilibrium" amount into K solve for $x$
