1. You have solutions of 0.01 M acetic acid and HCl .
a. Which solution, acetic acid and HCl , has a higher concentration of $\mathrm{H}^{+}$? Draw a picture of this solution to support your answer.
b. Which solution is drinkable? Do these solutions have the same or different pH ? Calculate the pH of each solution.
Why does a weak acid have a higher pH than the same concentration of strong acid?
c. Every acid has a conjugate base. The conjugate base of a strong acid is weak. The conjugate base of a weak acid is strong.
(i) Consider the reaction:

$$
\begin{array}{lll}
\mathrm{HCl}+\mathrm{H}_{2} \mathrm{O}--> & \mathrm{Cl}^{-} \\
\text {Acid } \\
\text { base } \\
\text { conjugate base } \\
\text { of } \mathrm{HCl}
\end{array}+\quad \begin{aligned}
& \mathrm{H}_{3} \mathrm{O}^{+} \\
& \text {conjugate acid } \\
& \text { of } \mathrm{H}_{2} \mathrm{O}
\end{aligned}
$$

This reaction is the acid dissociation reaction. A shortcut for this reaction is:

$$
\mathrm{HCl}(\mathrm{aq}) \text {--> } \mathrm{Cl}^{-} \quad+\quad \mathrm{H}^{+}(\mathrm{aq})
$$

The acid dissociation equilibrium constant, $\mathrm{K}_{\mathrm{a}}$, is: $\mathrm{K}_{\mathrm{a}}=[\mathrm{Cl}]\left[\mathrm{H}^{+}\right][\mathrm{HCl}]$
HCl is a strong acid. Is $\mathrm{K}_{\mathrm{a}}$ for HCl large or small?
Draw a picture of $\mathrm{HCl}(\mathrm{aq})$.
Use your picture of HCl to explain why conjugate base of HCl is weak. In other words, why doesn't the above reaction go in the reverse direction?
(ii) $\mathrm{H}_{2} \mathrm{O}$ can behave like an acid or a base:

$$
\mathrm{H}_{2} \mathrm{O}+\mathrm{H}_{2} \mathrm{O}->\quad \mathrm{OH}^{-} \quad+\quad \mathrm{H}_{3} \mathrm{O}^{+}(\mathrm{aq})
$$

This reaction is the water dissociation reaction. A shortcut for this reaction is:

$$
\mathrm{H}_{2} \mathrm{O} \quad-\mathrm{O} \quad \mathrm{OH}^{-} \quad+\quad \mathrm{H}^{+}(\mathrm{aq})
$$

The water dissociation equilibrium constant, $\mathrm{K}_{\mathrm{w}}$, is: $\mathrm{K}_{\mathrm{w}}=\left[\mathrm{OH}^{+}\right]\left[\mathrm{H}^{+}\right]=1 \times 10^{-14}$.
Draw a picture of $\mathrm{H}_{2} \mathrm{O}$.
Use your picture of $\mathrm{H}_{2} \mathrm{O}$ to explain why the conjugate acid of $\mathrm{H}_{2} \mathrm{O}$ is strong.
Use your picture of $\mathrm{H}_{2} \mathrm{O}$ to explain why the conjugate base of $\mathrm{H}_{2} \mathrm{O}$ is strong.
(iii) Consider the reaction:
$\mathrm{CH}_{3} \mathrm{COOH}+$

Acid $\quad$\begin{tabular}{l}
$\mathrm{H}_{2} \mathrm{O}-->$ \\
base

$\quad$

$\mathrm{CH}_{3} \mathrm{COO}^{-}$ \\
conjugate base \\
of $\mathrm{CH}_{3} \mathrm{COOH}$

$\quad$

+| $\mathrm{H}_{3} \mathrm{O}^{+}$ |
| ---: |
| conjugate acid |
| of $\mathrm{H}_{2} \mathrm{O}$ |

\end{tabular}

This reaction is the acid dissociation reaction. A shortcut for this reaction is:

$$
\mathrm{CH}_{3} \mathrm{COOH}(\mathrm{aq}) ~-->\quad \mathrm{CH}_{3} \mathrm{COO}^{-} \quad+\quad \mathrm{H}^{+}(\mathrm{aq})
$$

Write the acid dissociation equilibrium constant, $\mathrm{K}_{\mathrm{a}}$, for acetic acid.
$\mathrm{CH}_{3} \mathrm{COOH}$ is a weak acid. Is $\mathrm{K}_{\mathrm{a}}$ for $\mathrm{CH}_{3} \mathrm{COOH}$ large or small? Look up the $\mathrm{K}_{\mathrm{a}}$ of $\mathrm{CH}_{3} \mathrm{COOH}$. You can find a table of $K_{a}^{\prime}$ 's for weak acids in the textbook or on the internet.
(iv) When a base is dissolved in water, it reacts with water to form its conjugate acid and $\mathrm{OH}^{-}$. For example, sodium acetate $\left(\mathrm{NaCH}_{3} \mathrm{COO}\right)$ is a base. The $\mathrm{CH}_{3} \mathrm{COO}^{-}$part is the basic part of this compound.

| $\mathrm{CH}_{3} \mathrm{COO}^{-}$ |
| :--- | :--- | :--- |
| Base |$+$| acid |
| :--- | $\mathrm{H}_{2} \mathrm{O}->$| $\mathrm{CH}_{3} \mathrm{COOH}$ |
| :--- |
| conjugate acid |
| of $\mathrm{CH}_{3} \mathrm{COO}^{-}$ |$+$| $\mathrm{OH}^{-}$ |
| :--- |
| conjugate base |
| of $\mathrm{H}_{2} \mathrm{O}$ |

This reaction is the base hydrolysis reaction.
The base hydrolysis equilibrium constant, $\mathrm{K}_{\mathrm{b}}$, is: $\mathrm{K}_{\mathrm{b}}=\left[\mathrm{CH}_{3} \mathrm{COOH}\right]\left[\mathrm{OH}^{-}\right] /\left[\mathrm{CH}_{3} \mathrm{COO}^{-}\right]$.
A table of $K_{b}$ 's for weak bases are not as easily found as for $K_{a}$ 's. But you can calculate $K_{b}$ as long as you know the $K_{a}$ of the conjugate acid using the formula: $K_{a} K_{b}=K_{w}$.
What is the numerical value of $\mathrm{K}_{\mathrm{b}}$ for $\mathrm{CH}_{3} \mathrm{COO}^{-}$?
2. pH calculations for a weak acid - use $\mathrm{K}_{\mathrm{a}}$.
a. Aspirin has a $\mathrm{pK}_{\mathrm{a}}$ of 3.5 ; salicylic acid has a $\mathrm{pK}_{\mathrm{a}}$ of 2.98 . Is aspirin a stronger or weaker acid than salicylic acid? To confirm your answer, write the acid dissociation reaction for each acid, calculate the equilibrium constant, $\mathrm{K}_{\mathrm{a}}$, for each acid, and briefly discuss what the value of K means.
b. Acetic acid is the acid in vinegar. Write the acid dissociation reaction for this acid. Look up the $\mathrm{K}_{\mathrm{a}}$ of acetic acid. Calculate the pH of a 0.1 M acetic acid solution.
To calculate pH , do an equilibrium calculation:

$$
\mathrm{CH}_{3} \mathrm{COOH} \rightarrow \mathrm{CH}_{3} \mathrm{COO}^{-}(\mathrm{aq})+\quad \mathrm{H}^{+}(\mathrm{aq}) \quad \mathrm{K}_{\mathrm{a}}=1.8 \times 10^{-5}=\left[\mathrm{CH}_{3} \mathrm{COO}^{-}\right]
$$

$\left[\mathrm{H}^{+}\right] /\left[\mathrm{CH}_{3} \mathrm{COOH}\right]$
initial
0.1

0
0

| reacts | $x$ | $x$ | $x$ |
| :--- | :--- | :--- | :--- |
| equilibrium | $0.1-x$ | $x$ | $x$ |

equilibrium $\quad 0.1-x \quad x$
x
$\mathrm{K}_{\mathrm{a}}=1.8 \times 10^{-5}=[\mathrm{x}][\mathrm{x}] /[0.1-\mathrm{x}] \approx$
Note: $K_{a}$ is very small so $x$ is very small so assume $0.1-x \approx$ 0.1

Solve for $x=\left[\mathrm{H}^{+}\right]=1.34 \times 10^{-3} \mathrm{M}$
$\mathrm{pH}=-\log \left[\mathrm{H}^{+}\right]=-\log \left(1.34 \times 10^{-3}\right)=2.9$
The pH of a 0.1 M acetic acid solution is 2.9 .
Vinegar is 0.9 M acetic acid. Does vinegar have a higher or lower pH than 0.1 M acetic acid? Calculate the pH of vinegar to confirm your answer.
b. Carbonic acid is found in soda. Write the acid dissociation reaction for this acid. Look up the $\mathrm{K}_{\mathrm{a}}$ of carbonic acid. Calculate the pH of a 0.1 M carbonic acid solution. (Answer: pH between 3 and 4) c. Benzoic acid is found in food preservatives. Write the acid dissociation reaction for this acid. Look up the $\mathrm{K}_{\mathrm{a}}$ of benzoic acid. Calculate the pH of a 0.1 M benzoic acid solution. (Answer: pH between 2 and 3) d. Vinegar contains acetic acid and has a pH of 2.4. Calculate the concentration of acetic acid in vinegar. (Answer: between 0.8 and 1 M )
3. pH calculations for a weak base - use $\mathrm{K}_{\mathrm{b}}$.
a. You have 0.1 M solutions of NaOH (strong base) and $\mathrm{NaHCO}_{3}$ (weak base). Explain why the strong base has a higher pH than the weak base. Draw a picture of each solution to support your answer. b. Baking soda is sodium bicarbonate. What is the conjugate acid of baking soda? Write the base hydrolysis reaction for this base. Calculate $\mathrm{K}_{\mathrm{b}}$. Calculate pOH . Calculate pH . (Answers: pOH between 4 and 5 . pH between 9 and 10.)
c. Sodium salicylate is the conjugate base of salicylic acid. Write the base hydrolysis reaction for this base. Calculate $\mathrm{K}_{\mathrm{b}}$. Calculate pOH . Calculate pH . (Answer: pH between 7.5 and 8.5 )
4. Concentrated sulfuric acid (18 M) is used as the electrolyte in car batteries.
a. Calculate the pH of battery acid. ( pH will be negative.)
b. Sulfuric acid is a diprotic acid. However, $\mathrm{H}^{+}$and $\mathrm{HSO}_{4}^{-}$are the two ions predominantly present. Explain why the concentration of $\mathrm{SO}_{4}{ }^{2-}$ is very low in sulfuric acid.
c. At what pH will $\mathrm{HSO}_{4}{ }^{-}$and $\mathrm{SO}_{4}{ }^{2-}$ be observed? Give reasons.
