## Exam 2 solutions

1. Hard water is due to $\mathrm{Ca}^{2+}$ and $\mathrm{Mg}^{2+}$ ions in water. These ions come from water running over or sitting in a reservoir over limestone $\left(\mathrm{CaCO}_{3}, \mathrm{~K}_{\text {sp }}=3.8 \times 10^{-9}=3.8 \mathrm{E}-9\right)$ and dolomite $\left(\mathrm{MgCO}_{3}, \mathrm{~K}_{\text {sp }}=4.0 \times 10^{-5}=4.0 \mathrm{E}-\right.$ 5) minerals.
a. 1 mole of $\mathrm{CaCO}_{3}$ and 1 mole of $\mathrm{MgCO}_{3}$ are dumped into 1 liter of water. The concentration of $\mathrm{Ca}^{2+}=$ 6.2E-5 M.

The concentration of $\mathrm{Ca}^{2+}$ will be ___ than the concentration of $\mathrm{Mg}^{2+}$. To support my answer, I use the equation $\qquad$ and calculate the concentration of $\mathrm{Mg}^{2+}=$ $\qquad$ M. greater than (blank 1)
equal to (blank 1)
less than (blank 1)
Blank 2: Write the equation that involves the numerical value of $K$ and $x$, where $x=$ concentration of reactant/product in "Other". E.g., 1.0E-1 $=(x) /(x-1)$.
$4.0 \mathrm{E}-5=(\mathrm{x})(\mathrm{x})$
Blank 3: Write a number in scientific notation as _._E__ in "Other". E.g., 1.1E11. Use 2 significant figures. Do not include text.
6.3E-3
$4.0 \mathrm{E}-5=(\mathrm{x})(\mathrm{x})$
Solve for $x=6.3 E-3=\left[\mathrm{Mg}^{2+}\right]$
b. To remove unsightly hard water stains from by cups and glasses, this reaction

$$
\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{~s}) \rightleftharpoons \mathrm{Ca}^{2+}(\mathrm{aq})+2 \mathrm{OH}^{-}(\mathrm{aq})
$$

tells me I would use a $\qquad$ because this substance reacts with $\qquad$ and shifts the reaction to the $\qquad$ side. acid (blank 1)
base (blank 1)
soap (blank 1)
$\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{~s})$ (blank 2)
$\mathrm{Ca}^{2+}(\mathrm{aq})$ (blank 2)
$\mathrm{OH}^{-}(\mathrm{aq})$ (blank 2)
reactant (blank 3)
product (blank 3)
either (blank 3)
2. When a fuel, such as ethanol $\left(\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}\right)$, is burned, energy, water, and carbon dioxide are produced:

$$
\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}+\mathrm{O}_{2}-->\mathrm{H}_{2} \mathrm{O}+\mathrm{CO}_{2} \text { (not balanced). }
$$

Carbon dioxide is a greenhouse gas. $\mathrm{CO}_{2}(\mathrm{~g})$ in the earth's atmosphere is absorbed by the the oceans in an equilibrium reaction:

$$
\mathrm{CO}_{2}(\mathrm{~g}) \rightleftharpoons \mathrm{CO}_{2}(\mathrm{aq}) \quad \mathrm{K}=3.36 \times 10^{-2}=3.36 \mathrm{E}-2 \text { at } \mathrm{T}=25^{\circ} \mathrm{C} .
$$

$\mathrm{CO}_{2}$ also reacts with water to produce $\mathrm{H}^{+}$and $\mathrm{HCO}_{3}$ :

$$
\mathrm{CO}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightleftharpoons \mathrm{H}^{+}+\mathrm{HCO}_{3}^{-} \quad \mathrm{K}=4.3 \times 10^{-7}=4.3 \mathrm{E}-7 \text { at } \mathrm{T}=25^{\circ} \mathrm{C}
$$

a. The K for the ethanol burning reaction is $\qquad$ 1 because ethanol burns and $\qquad$ In the picture, there is $\mathrm{CO}_{2}$ in gas phase than the liquid phase because $\qquad$ -. Blank 4: give reasons in "Other".

greater than (blank 1)
equal to (blank 1)
less than (blank 1)
makes a lot of products (blank 2)
makes few products (blank 2)
more (blank 3)
same (blank 3)
less (blank 3)
Other
K is less than 1
b. I support my answer to part a because when 1 mole of $\mathrm{CO}_{2}(\mathrm{~g})$ is bubbled into 1 liter of water at $25^{\circ} \mathrm{C}$, I use the equation $\qquad$ and calculate $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=$ $\qquad$ M.

Blank 1: Write the equation that involves the numerical value of K and x , where $\mathrm{x}=$ concentration of reactant/product. E.g., 1.0E-1 = $(x) /(x-1)$.
3.36E-2 $=x /(1-x)$
or
3.36E-2 $=x /(1)$

Blank 2: Write a number in scientific notation as _._E__ in "Other". E.g., 1.1E11. Use 2 significant figures. Do not include text.
0.033
0.0325 to 0.0336

Calculate $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=$ $\qquad$ M.
$K=3.36 \times 10^{-2}=x /(1-x)$
Solve for $x=0.0325$.
Assume $1-x=1$ (since $K=3.36 \times 10^{-2}$ is very small compared to initial concentration of 1 M , solve for $\mathrm{x}=$ 0.0336 .
c. Earlier in Chem 1B, we learned that gases are $\qquad$ soluble in hot water than cold water. This means the $\mathrm{CO}_{2}(\mathrm{~g}) \rightleftharpoons \mathrm{CO}_{2}(\mathrm{aq})$ reaction is $\qquad$ because heat is a $\qquad$ and as temperature increases, the reaction shifts to the __ side. This also tells us as the earth's temperature rises, $\qquad$ $\mathrm{CO}_{2}$ gas dissolves in the ocean.
more (blank 1)
same (blank 1)
less (blank 1)
exothermic (blank 2)
endothermic (blank 2)
reactant (blank 3)
product (blank 3)
reactant (blank 4)
product (blank 4)
more (blank 5)
same (blank 5)
less (blank 5)
3. $\mathrm{CO}_{2}$ is also involved in our blood buffer:

$$
\mathrm{CO}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightleftharpoons \mathrm{H}^{+}(\mathrm{aq})+\mathrm{HCO}_{3}^{-}(\mathrm{aq}) \quad \mathrm{K}=7.9 \times 10^{-7}=7.9 \mathrm{E}-7 \text { at } 37^{\circ} \mathrm{C}
$$

a. $\mathrm{CO}_{2}(\mathrm{aq})$ behaves like an acid in this reaction. In a titration curve of this acid, the pH at the half-way point is $\qquad$ . This means at blood pH of $7.4,\left[\mathrm{CO}_{2}(\mathrm{aq})\right]$ is $\qquad$ $\left[\mathrm{HCO}_{3}^{-}(\mathrm{aq})\right]$ and the ratio of $\left[\mathrm{HCO}_{3}^{-}(\mathrm{aq})\right] /$ $\left[\mathrm{CO}_{2}(\mathrm{aq})\right]$ is $\qquad$ _.
Blank 1: give a number with 2 significant figures in "Other". Do not include text. Blank 3: give a number with 2 significant figures in "Other". Do not include text. Separate each answer with a comma.
Greater than (blank 2)
Equal to (blank 2)
less than (blank 2)
Other
6.1, 20
$\mathrm{pKa}=-\log \mathrm{Ka}=-\log (7.9 \mathrm{E}-7)=6.1$
Use H-H equation: $7.4=6.1+\log \left[\mathrm{HCO}_{3}{ }^{-}(\mathrm{aq})\right] /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]$
Solve for $\left[\mathrm{HCO}_{3}{ }^{-}(\mathrm{aq})\right] /\left[\mathrm{CO}_{2}(\mathrm{aq})\right]=20$.
b. When a person starts to hyperventilate, the person breathes rapidly and rapidly exhales $\mathrm{CO}_{2}$. This causes pH to $\qquad$ because $\qquad$ is $\qquad$ and shifts the reaction to the $\qquad$ side.
increase (blank 1)
decrease (blank 1)

product (blank 2)
neither (blank 2)
added (blank 3)
removed (blank 3)
neither (blank 3)
reactant (blank 4)
product (blank 4)
neither (blank 4)
4. Hemoglobin is the oxygen carrier in blood that transports oxygen from our lungs to tissues. Hemoglobin is a protein and exists as deoxygenated hemoglobin ( $\mathrm{H} \mathrm{Hgb}, \mathrm{pK}_{\mathrm{a}}=7.7$ ) and its conjugate base $(\mathrm{Hgb})$ and oxygenated hemoglobin $\left(\mathrm{H} \mathrm{Hgb} \mathrm{O}_{2}, \mathrm{pK}_{\mathrm{a}}=6.2\right)$ and its conjugate base $\left(\mathrm{Hgb} \mathrm{O}_{2}\right)$.
Reaction 1: $\mathrm{H} \mathrm{Hgb} \rightleftharpoons \mathrm{H}^{+}+\mathrm{Hgb} \quad \mathrm{pK}_{\mathrm{a}}=7.7$
Reaction 2: $\quad \mathrm{H} \mathrm{Hgb} \mathrm{O}_{2} \rightleftharpoons \mathrm{H}^{+}+\mathrm{Hgb} \mathrm{O}_{2} \quad \mathrm{pK}_{\mathrm{a}}=6.2$
These two reactions show how well $\mathrm{O}_{2}$ binds to the acid and base forms of hemoglobin:
Reaction 3: $\mathrm{H} \mathrm{Hgb} \mathrm{O}_{2} \rightleftharpoons \mathrm{H} \mathrm{Hgb}+\mathrm{O}_{2} \quad \mathrm{~K}_{\mathrm{o} 2}=1$
Reaction 4: $\mathrm{Hgb} \mathrm{O}_{2} \rightleftharpoons \mathrm{Hgb}+\mathrm{O}_{2}$
$\mathrm{K}^{\prime} \mathrm{O} 2=0.032$

a. The form of hemoglobin that is the strongest acid is $\qquad$ . The form of hemoglobin that binds to oxygen better is $\qquad$ because $\qquad$ Blank 3: give reasons in "Other".
H Hgb (blank 1)
Hgb (blank 1)
H Hgb O 2 (blank 1)
$\mathrm{Hgb} \mathrm{O}_{2}$ (blank 1)
H Hgb (blank 2)
Hgb (blank 2)
Other
Lower K'o2 means more reactant (Hgb O2).
b. The pH of blood is 7.4. When hemoglobin is oxygenated to form $\mathrm{H} \mathrm{Hgb} \mathrm{O}_{2}$, there is $\qquad$ $\mathrm{Hbg} \mathrm{O}_{2}$ than H Hgb O 2 because the pH of blood is $\qquad$ the half-way point (Point $A$ ) in the titration curve of this acid with a base. In the tissues where the $\mathrm{O}_{2}$ concentration is low, Reaction 4 shifts to the $\qquad$ side and $\mathrm{Hbg} \mathrm{O} \mathrm{O}_{2}$ releases $\mathrm{O}_{2}$.

more (blank 1)
less (blank 1)
same (blank 1)
before (blank 2)
at (blank 2)
after (blank 2)
reactant (blank 3)
product (blank 3)
c. When hemoglobin is oxygenated, this reaction shifts to the products: $\mathrm{H} \mathrm{Hgb} \mathrm{O}_{2} \rightleftharpoons \mathrm{H}^{+}+\mathrm{Hgb} \mathrm{O}_{2}$.

The blood pH $\qquad$ because $\left[\mathrm{H}^{+}\right]$ $\qquad$ and affects a second reaction: $\mathrm{H}^{+}+\mathrm{HCO}_{3}^{-} \rightleftharpoons \mathrm{H}_{2} \mathrm{O}+\mathrm{CO}_{2}(\mathrm{~g})$ and makes this reaction shift to the product side. Our body $\qquad$ the excess $\mathrm{CO}_{2}(\mathrm{~g})$ because our body is an system.
Blank 3: give a 1 or 2 word answer in "Other". Blank 4: give a 1 word answer in "Other". Separate each answer with a comma.
increases (blank 1)
decreases (blank 1)
stays the same (blank 1)
increases (blank 2)
decreases (blank 2)
stays the same (blank 2)
Other
Exhale, open
We exhale excess $\mathrm{CO}_{2}$ out of our lungs into the atmosphere. The $\mathrm{CO}_{2} / \mathrm{HCO}_{3}{ }^{-}$blood buffer system is an open system that helps keep the pH of our blood between 7 and 7.5.

Quiz 8 solutions

1. This titration curve could represent 20 ml of 0.1 M $\qquad$ with 0.1 M NaOH . The pH at Point C is calculated with $\qquad$ _.

CH 3 COOH (blank 1)
H2CO3 (blank 1)
H3PO4 (blank 1)
$\mathrm{pH}=\mathrm{pKa1}$ (blank 2)
$\mathrm{pH}=\mathrm{pKa} 2$ (blank 2)
$\mathrm{pH}=\mathrm{pKa} 3$ (blank 2)
$\mathrm{pH}=0.5\left(\mathrm{pK}_{\mathrm{a} 1}+\mathrm{pK}_{\mathrm{a} 2}\right)($ blank 2)
$\mathrm{pH}=0.5\left(\mathrm{pK}_{\mathrm{a} 2}+\mathrm{pK}_{\mathrm{a} 3}\right)($ blank 2)
$\mathrm{K}_{\mathrm{a} 1}$ and doing an equlibrium calculation (blank 2)
$\mathrm{K}_{\mathrm{b}}$ and doing an equlibrium calculation (blank 2)
2. Soda has a pH between 3 and 4 . Soda makers often add phosphoric acid to give a tart taste to soda. 20 ml of 0.1 M phosphoric acid $\left(\mathrm{H}_{3} \mathrm{PO}_{4}, \mathrm{pK}_{\mathrm{a} 1}=2.1, \mathrm{pK}_{\mathrm{a} 2}=7.2, \mathrm{pK}_{\mathrm{a} 3}=12.3\right)$ is titrated with 0.1 M NaOH .

a. In the phosphoric acid titration curve, pH 4.65 is the pH at the $\qquad$ . pH 7.2 is the pH at the $\qquad$ . starting point (blank 1)
$1^{\text {st }} 1 / 2$ way point (blank 1 )
$1^{\text {st }}$ endpoint (blank 1)
$2^{\text {nd }} 1 / 2$ way point (blank 1 )
$2^{\text {nd }}$ endpoint (blank 1)
$3^{\text {rd }} 1 / 2$ way point (blank 1 )
$3^{\text {rd }}$ endpoint (blank 1)
$4^{\text {th }} 1 / 2$ way point (blank 1)
$4^{\text {th }}$ endpoint (blank 1)
starting point (blank 2)
$1^{\text {st }} 1 / 2$ way point (blank 2)
$1^{\text {st }}$ endpoint (blank 2)
$2^{\text {nd }} 1 / 2$ way point (blank 2)
$2^{\text {nd }}$ endpoint (blank 2)
$3^{\text {rd }} 1 / 2$ way point (blank 2)
$3^{\text {rd }}$ endpoint (blank 2)
$4^{\text {th }} 1 / 2$ way point (blank 2 )
$4^{\text {th }}$ endpoint (blank 2)
b. To calculate the pH at the $3^{\text {rd }}$ endpoint in the phosphoric acid titration curve, I would need to know $\mathrm{K}_{\mathrm{b}}$ and set up an equilibrium calculation using the $\qquad$ reaction. The numerical value of $K_{b}$ is $\qquad$ .
$1^{\text {st }}$ blank: give a one or two word answer. $2^{\text {nd }}$ blank: Write a number in scientific notation as _._E_ _ . E.g.,
1.1E11. Use 2 significant figures. Separate each answer with a comma.

Base hydrolysis, $\mathrm{K}_{\mathrm{b}}=\mathrm{K}_{\mathrm{w}} / \mathrm{K}_{\mathrm{a} 3}=1 \mathrm{E}-14 / 10^{-12.3}=2.0 \mathrm{E}-02$
c. I could use phosphate $\left(\mathrm{PO}_{4}^{-3}\right)$ and $\qquad$ to make a pH $\qquad$ buffer.
$\mathrm{H}_{3} \mathrm{PO}_{4}$ (blank 1)
$\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$(blank 1)
$\mathrm{HPO}_{4}^{-2}$ (blank 1)
$\mathrm{PO}_{4}^{-3}$ (blank 1)
2 (blank 2)

5 (blank 2)
7 (blank 2)
12 (blank 2)
d. To make soda with a pH of 3.5 , I would use $\qquad$ as the acid and $\qquad$ as the base. The ratio of [base] to [acid] is
Blank 3: give a number with 3 significant figures only in "Other". Do not include text.
$\mathrm{H}_{3} \mathrm{PO}_{4}$ (blank 1)
$\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$(blank 1)
$\mathrm{HPO}_{4}{ }^{-2}$ (blank 1)
$\mathrm{PO}_{4}{ }^{-3}$ (blank 1)
$\mathrm{H}_{3} \mathrm{PO}_{4}$ (blank 2)
$\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$(blank 2)
$\mathrm{HPO}_{4}^{-2}$ (blank 2)
$\mathrm{PO}_{4}{ }^{-3}$ (blank 2)
Other
25.1

Use Henderson-Hasselbach equation: $\mathrm{pH}=\mathrm{pKa}+\log$ ([base]/[acid]).
$3.5=2.1+\log \left(\left[\mathrm{H}_{2} \mathrm{PO}_{4}^{-}\right] /\left[\mathrm{H}_{3} \mathrm{PO}_{4}\right]\right)$
$\log \left(\left[\mathrm{H}_{2} \mathrm{PO}_{4}^{-}\right] /\left[\mathrm{H}_{3} \mathrm{PO}_{4}\right]\right)=1.4$
$\left(\left[\mathrm{H}_{2} \mathrm{PO}_{4}{ }^{-}\right] /\left[\mathrm{H}_{3} \mathrm{PO}_{4}\right]\right)=10^{1.4}=25.1$

## Quiz 7 solutions

1. Consider the acid dissociation reaction: $\mathrm{HA}<==>\mathrm{H}^{+}+\mathrm{A}^{-}$.

For a weak acid at equilibrium, there is $\qquad$ HA than $\mathrm{H}^{+}+\mathrm{A}^{-}$. This means $\mathrm{K}_{\mathrm{a}}$ for this reaction is $\qquad$ and
pKa should be $\qquad$ —.
